Understanding the SMED System SH

What is SMED?

SMED stands for Single-Minute Exchange of Die. It is a methodology developed by Shigeo Shingo in the 1950s aimed at reducing machine changeover times to less than 10 minutes (single digits). While originally focused on die changes in manufacturing, the principles are applicable to all types of setup activities across various industries.

The Core Concept of SMED

The fundamental idea behind SMED is to analyze and categorize all changeover activities into two groups:

- Internal activities: Tasks that can only be performed when the machine is stopped.
- External activities: Tasks that can be performed while the machine is running.

By converting as many internal activities into external activities and optimizing their execution, changeover time can be minimized significantly.
