Introduction to Heat and Mass Transfer

Heat and mass transfer are interconnected phenomena that occur in numerous natural and engineered systems. They involve the transfer of thermal energy and mass from one point to another, driven by differences in temperature, concentration, or other properties.

What is Heat Transfer?

Heat transfer refers to the movement of thermal energy from a hotter region to a cooler one. It occurs via three primary modes:

- **Conduction:** Transfer of heat through a solid material without any movement of the material itself.
- **Convection:** Transfer of heat through fluid motion, either natural or forced.
- **Radiation:** Transfer of heat through electromagnetic waves without the need for a medium.

What is Mass Transfer?

Mass transfer involves the movement of molecules or particles from one location to another, often driven by concentration gradients. Common examples include diffusion of gases, evaporation, and absorption processes.

Fundamental Principles of Sachdeva Heat and Mass Transfer

Understanding the core principles underpinning heat and mass transfer is essential for analyzing complex systems. Sachdeva's approach emphasizes the application of these principles in practical engineering contexts.

Fourier's Law of Heat Conduction

$$q = -k \frac{dT}{dx}$$

where:

- **q**: heat flux
- **k**: thermal conductivity
- **dT/dx**: temperature gradient

Newton's Law of Cooling

Describes convective heat transfer:

$$Q = h A (T_s - T_{\infty})$$

where:

- **Q**: heat transfer rate
- **h**: convective heat transfer coefficient
- **A**: surface area
- **T_s**: surface temperature
- **T_∞**: fluid temperature away from the surface

Fick's Law of Diffusion

Describes mass transfer by diffusion:

$$J = -D \frac{dC}{dx}$$

where:

- **J**: diffusion flux
- **D**: diffusion coefficient
- **dC/dx**: concentration gradient
