Answer: c) White blood cells

Open-Ended Questions

Question 4:

Describe the process of photosynthesis and explain its importance to life on Earth.

Sample Answer:

Photosynthesis is the process by which green plants, algae, and some bacteria convert light energy into chemical energy stored in glucose molecules. This process occurs in the chloroplasts, where chlorophyll absorbs sunlight. During photosynthesis, carbon dioxide and water are used to produce glucose and oxygen. The equation for photosynthesis is:

Photosynthesis is vital because it provides the primary energy source for all living organisms and maintains atmospheric oxygen levels.

Question 5:

Explain how natural selection can lead to evolution within a species.

Sample Answer:

Natural selection occurs when environmental pressures favor certain traits over others, leading individuals with advantageous traits to survive and reproduce more successfully. Over time, these traits become more common in the population, resulting in evolutionary change. For example, if a population of insects develops resistance to a pesticide, the resistant insects are more likely to survive and pass on their resistance genes, leading to a shift in the population's characteristics.
