Understanding Linear Functions

Definition and Key Features

Linear functions are mathematical expressions that graph as straight lines on the coordinate plane. They are characterized by a constant rate of change, known as the slope, and a y-intercept, which is the point where the line crosses the y-axis.

A general form of a linear function is:

$$y = mx + b$$

where:

- m is the slope of the line,
- b is the y-intercept.

Graphing Linear Functions

To graph a linear function:

- Identify the slope m and y-intercept b .
- Plot the y-intercept on the graph.
- Use the slope to determine additional points by rising and running from the y-intercept.
- Draw the straight line passing through these points.

Solving Linear Function Problems

Common problems involve:

- Finding the equation of a line given two points,
- Determining the slope given two points,
- Calculating the y-intercept,
- Solving for a variable given the function.

Example Problem:

Find the equation of the line passing through points (2, 3) and (4, 7).

Solution:

- Calculate the slope (m) :

$$m = \frac{7 - 3}{4 - 2} = \frac{4}{2} = 2$$

- Use point-slope form with point (2, 3):

$$y - 3 = 2(x - 2)$$

- Simplify to slope-intercept form:

$$y = 2x - 4 + 3 = 2x - 1$$

Answer: The equation is $y = 2x - 1$.

Understanding Exponential Functions

Definition and Key Features

Exponential functions describe situations where quantities grow or decay at rates proportional to their current value. Their general form is:

$$y = a \times b^x$$

where:

- a is the initial amount (when $x = 0$),
- b is the base, representing the growth factor (if $b > 1$) or decay factor (if $0 < b < 1$).

Graphing Exponential Functions

To graph an exponential function:

- Identify the initial value a .
- Determine the base b to understand whether the function models growth or decay.
- Plot points for specific x -values, such as $x = 0, 1, 2$ and $x = -1$.
- Sketch the curve, noting its characteristic exponential growth or decay.

Solving Exponential Function Problems

Common problems include:

- Finding the exponential function given data points,
- Modeling real-world growth or decay scenarios,
- Solving for x in exponential equations.

Example Problem:

A population of bacteria doubles every 3 hours. If the initial population is 500, what is the exponential model?

Solution:

- $a = 500$,
- The doubling period: $b = 2$,
- Time period per doubling: 3 hours.

The function:

$$y = 500 \times 2^{x/3}$$

where x is in hours.

Answer: The exponential model is $y = 500 \times 2^{x/3}$.

Graphing Linear and Exponential Functions

- For linear functions:
 - Plot the y-intercept $(0, b)$.
 - Use the slope m to find subsequent points.
 - Draw a straight line through these points.
- For exponential functions:
 - Identify the initial value a .
 - Determine the growth or decay factor b .
 - Plot points for $(x=0, 1, 2)$, etc., to visualize the exponential curve.

Transformations and Variations

- Shifting, reflecting, and stretching graphs affect answers.
- Recognize how changing parameters (m, b, a, b) alters the graph and the corresponding solutions.

Common Types of Questions and How to Approach Them

The answers in Unit 3 often involve solving, graphing, and interpreting linear and exponential functions. Below are typical question types along with strategies.

1. Solving for Function Parameters

- Given two points, find the linear function:
- Use the slope formula $m = \frac{y_2 - y_1}{x_2 - x_1}$.

- Plug (m) and one point into $(y=mx+b)$ to find (b) .
- Answer example: For points $(2, 3)$ and $(4, 7)$, slope $(m=\frac{7-3}{4-2}=2)$. Then, $(3=2(2)+b \rightarrow b=-1)$. The function: $(f(x)=2x-1)$.

- Given points and an exponential pattern, find (a) and (b) :
- Use the known points to set up equations.
- Solve the system to find parameters.

2. Graphing Functions

- Use known points or intercepts to sketch.
- For exponential functions, recognize that:
 - $(f(0)=a)$.
 - The function passes through $((1, a \times b))$.

3. Interpreting Function Parameters

- Understand the meaning of (m, b, a, b) :
- Slope (m) indicates rate of change.
- Y-intercept (b) is the starting point.
- Exponential base (b) indicates growth $(b>1)$ or decay $(0<b<1)$.

4. Solving Real-world Problems

- Translate word problems into equations.
- Identify if the problem models linear or exponential change.
- Set up equations based on given data points or descriptions.
- Solve for unknown quantities.

Answer Strategies and Step-by-Step Solutions

Effective problem-solving hinges on systematic approaches. Here are detailed strategies for typical problems:

Linear Function Problems

- Step 1: Identify two points or a point and slope from the problem.
- Step 2: Calculate the slope (m) .
- Step 3: Use the point-slope form $(y - y_1 = m(x - x_1))$ or slope-intercept form to find (b) .
- Step 4: Write the full function.
- Step 5: Verify the solution by plugging in other points if available.

Exponential Function Problems

- Step 1: Determine the initial value (a) (usually $(f(0))$).
- Step 2: Use known points to find the base (b) . For example, if $(f(1)=a \times b)$, then $(b = \frac{f(1)}{a})$.
- Step 3: Write the function $(f(x)=a \times b^x)$.
- Step 4: Check the function with additional data or graphs.

Applying Logarithms to Solve Exponential Equations

- Often, questions require solving for (x) in equations like $(a \times b^x = y)$.
- Take logarithms (common or natural):
- $(\log_b (a \times b^x) = \log_b y)$.
- Simplify to $(x = \log_b \frac{y}{a})$.
- Use change of base if necessary:
- $(x = \frac{\log y - \log a}{\log b})$.

Common Answer Pitfalls to Avoid

- Forgetting to check the domain restrictions, especially in exponential functions where $(b > 0)$ and $(b \neq 1)$.
- Mixing up the parameters (a) and (b) .
- Miscalculating slopes or intercepts.
- Ignoring the context of a word problem, leading to incorrect interpretations.

Sample Problems and Detailed Solutions

To illustrate the depth of understanding required, here are some sample problems with comprehensive solutions:

Problem 1: Find the Equation of a Line

Given points $((3, 5))$ and $((7, 13))$, find the linear function $(f(x))$.

Solution:

- Calculate slope: $(m = \frac{13 - 5}{7 - 3} = \frac{8}{4} = 2)$.
- Use point-slope form with point $((3, 5))$:

$$\begin{aligned} &[\\ y - 5 &= 2(x - 3) \rightarrow y - 5 = 2x - 6 \rightarrow y = 2x - 1 \end{aligned}$$

$]$

- Answer: $(f(x) = 2x - 1)$.

Problem 2: Model Population Growth

A population starts at 500 individuals and increases by 8% annually. Write the exponential function modeling this growth.

Solution:

- Initial amount $(a = 500)$.
- Growth rate $(r = 8\% = 0.08)$.
- Exponential function: $(f(x) = 500 \times (1 + 0.08)^x = 500 \times 1.08^x)$.

Answer: $(f(x) = 500 \times 1.08^x)$.

Problem 3: Find the Time for Population to Double

Using the model $(f(x) = 500 \times 1.08^x)$, how long will it take for the population to reach 1000?

Solution:

- Set $(f(x) = 1000)$:

$[$

$$1000 = 500 \times 1.08^x \Rightarrow 2 = 1.08^x$$

]

- Take natural logarithm:

[

$$\ln 2 = x \ln 1.08 \Rightarrow x = \frac{\ln 2}{\ln 1.08}$$

]

- Calculate:

Question What is the main difference between linear and exponential functions? Linear functions have a constant rate of change and are represented by a straight line, while exponential functions have a constant percentage rate of change and are represented by a curve that either grows or decays rapidly. How do you identify the equation of a linear function from its graph? A linear function's graph is a straight line, and its equation can be identified in the form $y = mx + b$, where m is the slope and b is the y-intercept. What is the general form of an exponential function? The general form of an exponential function is $y = a \cdot b^x$, where a is the initial value, b is the base (growth or decay factor), and x is the independent variable. How can you determine if a function is exponential from a table of values? If the ratios of successive y-values are constant (i.e., $y_2/y_1 = y_3/y_2 = \dots$), the function is exponential. For linear functions, the differences between successive y-values are constant. What is the significance of the base 'b' in an exponential function? The base 'b' determines the rate of growth (if $b > 1$) or decay (if $0 < b < 1$).
