Detailed Explanation of Selected Questions from the June 2013 Physics Regents

Below, we will analyze several representative questions from the exam, focusing on their solutions

and underlying principles.

Question 1: Kinematics and Velocity

Question: A car accelerates uniformly from a velocity of 20 m/s to 30 m/s over a distance of 200 meters. What is the acceleration of the car?

Answer:

Step 1: Identify knowns:

- Initial velocity, $(v_i = 20, \text{m/s})$
- Final velocity, $(v_f = 30, \text{m/s})$
- Distance traveled, $(d = 200, \text{m})$

Step 2: Use the kinematic equation:

$$[$$

$$v_f^2 = v_i^2 + 2ad$$

$$]$$

Step 3: Plug in known values:

$$[$$

$$(30)^2 = (20)^2 + 2a(200)$$

$$]$$

$$[$$

$$900 = 400 + 400a$$

$$]$$

Step 4: Solve for (a) :

$$[$$

$$900 - 400 = 400a$$

$$\sqrt{}$$

$$\sqrt{}$$

$$500 = 400a$$

$$\sqrt{}$$

$$\sqrt{}$$

$$a = \frac{500}{400} = 1.25 \, \text{m/s}^2$$

$$\sqrt{}$$

Final Answer: The acceleration is $1.25 \, \text{m/s}^2$.

Explanation: This question demonstrates the application of the kinematic equation relating velocities, acceleration, and displacement. It emphasizes understanding how to manipulate the equations of motion to solve for unknowns in uniformly accelerated motion.

Question 2: Conservation of Momentum

Question: Two ice skaters, skater A with mass 50 kg and skater B with mass 70 kg, push off against each other on ice. Skater A moves to the right at 3 m/s. What is the velocity of skater B immediately after pushing off?

Answer:

Step 1: Recognize that momentum is conserved:

$$\sqrt{}$$

$$\text{Total initial momentum} = \text{Total final momentum}$$

$$\sqrt{}$$

Since both start at rest:

$$\sqrt{}$$

$$0 = m_A v_A + m_B v_B$$

\]

Given:

- $(m_A = 50\text{ kg})$

- $(v_A = 3\text{ m/s})$

- $(m_B = 70\text{ kg})$

- $(v_B = ?)$

Step 2: Solve for (v_B) :

\[

$$0 = (50)(3) + (70)(v_B)$$

\]

\[

$$0 = 150 + 70 v_B$$

\]

\[

$$70 v_B = -150$$

\]

\[

$$v_B = -\frac{150}{70} \approx -2.14\text{ m/s}$$

\]

Step 3: Interpret the sign:

- The negative sign indicates skater B moves in the opposite direction to skater A (to the left).

Final Answer: Skater B's velocity is approximately 2.14 m/s to the left.

Explanation: This problem highlights the principle of conservation of momentum in isolated systems. It reinforces understanding of how momentum before and after an interaction remains constant, and the importance of sign conventions in velocity.

Common Question Types and How to Approach Them

Understanding the typical question types in the Physics Regents can help students develop effective strategies for exam success.

Multiple-Choice Questions

- Approach: Read each question carefully, eliminate obviously incorrect choices, and perform quick calculations or reasoning to identify the best answer.
- Tip: Practice mental math and unit analysis to speed up decision-making.

Short-Answer Questions

- Approach: Clearly state your reasoning, show all necessary steps, and include units for final answers.
- Tip: Practice writing concise, complete explanations to maximize points.

Lab-Based or Extended Response Questions

- Approach: Read the problem thoroughly, identify what is being asked, and plan your solution before writing.
- Tip: Use diagrams where applicable, organize your work logically, and check your calculations.

Key Physics Concepts Explained with Examples

Below are core concepts frequently tested in the June 2013 exam, with clear explanations and examples.

Newton's Laws of Motion

- First Law (Inertia): An object at rest remains at rest, and an object in motion continues at constant velocity unless acted upon by an external force.
- Second Law: $(F = ma)$. The acceleration of an object depends on the net force and its mass.
- Third Law: For every action, there is an equal and opposite reaction.

Example: Calculating the force needed to accelerate a 10 kg object at 2 m/s²:

$\{$

$$F = ma = 10 \times 2 = 20 \text{ N}$$

$\}$

Work, Energy, and Power

- Work: Done when a force causes displacement ($W = Fd \cos \theta$)
- Kinetic Energy: $KE = \frac{1}{2} mv^2$
- Potential Energy: $PE = mgh$
- Power: Rate of doing work ($P = \frac{W}{t}$)

Example: A 5 kg object is lifted 3 meters in 2 seconds. Calculate the work done and power:

$\{$

$$W = mgh = 5 \times 9.8 \times 3 = 147 \text{ J}$$

$\}$

$\{$

$$P = \frac{147}{2} = 73.5 \text{ W}$$

$\}$

Tips for Success on the Physics Regents Exam

- Review Key Formulas: Make a list of important equations and understand their derivations.
- Practice Past Exams: Familiarity with question formats and typical problem types enhances confidence.

- Understand Units: Always include units in your answers to avoid loss of points.
- Time Management: Allocate time wisely, spending more time on questions worth more points.

The exam comprised multiple-choice questions, short-answer questions, and a lab-based question. Understanding the structure and the types of questions asked is crucial for effective preparation.

Key Features of the June 2013 Exam:

- A balanced mix of conceptual and calculation-based questions
- Emphasis on applying formulas to real-world scenarios

- Demonstration of understanding through explanations and justifications
- Use of diagrams, graphs, and data tables to analyze problems

Detailed Explanation of Selected Questions and Answers

Below, we analyze specific questions from the June 2013 exam, explaining the reasoning behind the correct answers and highlighting common pitfalls.

Question 1: Kinematics ? Velocity and Acceleration

Question:

A car accelerates uniformly from a velocity of 10 m/s to 30 m/s over a distance of 200 meters. What is the acceleration of the car?

Answer:

Using the kinematic equation:

$$v^2 = u^2 + 2as$$

where:

- $v = 30 \text{ m/s}$ (final velocity)
- $u = 10 \text{ m/s}$ (initial velocity)
- $s = 200 \text{ m}$ (distance)

Rearranged for acceleration a :

$$a = \frac{v^2 - u^2}{2s}$$

Plugging in the numbers:

$$a = \frac{(30)^2 - (10)^2}{2 \times 200} = \frac{900 - 100}{400} = \frac{800}{400} = 2 \text{ m/s}^2$$

Explanation:

The key here is recognizing the right kinematic formula to use. Since the problem provides initial and final velocities along with distance, the equation $v^2 = u^2 + 2as$ is most straightforward.

Pros of this approach:

- Simplifies calculation without needing time.
- Directly relates velocities and displacement.

Common mistakes:

- Using the wrong formula, such as $v = u + at$, which requires time.
- Forgetting to square velocities or mishandling units.

Question 2: Newton's Second Law ? Forces and Acceleration

Question:

A 10 kg box is pulled across a surface with a constant force of 50 N. If the coefficient of kinetic friction between the box and the surface is 0.2, what is the acceleration of the box?

Answer:

First, find the force of kinetic friction:

$$f_{\text{friction}} = \mu_k \times N$$

Since the surface is horizontal, normal force $(N = mg)$:

$$N = 10 \, \text{kg} \times 9.8 \, \text{m/s}^2 = 98 \, \text{N}$$

$$f_{\text{friction}} = 0.2 \times 98 \, \text{N} = 19.6 \, \text{N}$$

Net force:

$$F_{\text{net}} = F_{\text{applied}} - f_{\text{friction}} = 50 \, \text{N} - 19.6 \, \text{N} = 30.4 \, \text{N}$$

Using Newton's second law:

$$a = \frac{F_{\text{net}}}{m} = \frac{30.4}{10} = 3.04 \, \text{m/s}^2$$

Explanation:

This problem underscores the importance of accounting for all forces acting on an object. The net force determines the acceleration. Friction opposes motion and must be subtracted from the applied force to find the net force.

Pros:

- Reinforces understanding of friction and normal force.
- Demonstrates practical application of Newton's second law.

Common mistakes:

- Neglecting the frictional force.
- Using incorrect normal force calculations if the surface is inclined.

Question 3: Energy and Work

Question:

A 5 kg object is lifted vertically upward a height of 10 meters. What is the increase in the object's gravitational potential energy?

Answer:

Using the formula for gravitational potential energy:

$$\Delta U = mgh$$

where:

- $m = 5 \text{ kg}$
- $g = 9.8 \text{ m/s}^2$
- $h = 10 \text{ m}$

Calculating:

$$\Delta U = 5 \times 9.8 \times 10 = 490 \text{ J}$$

Explanation:

Lifting an object increases its potential energy proportionally to its mass, height, and gravitational acceleration. This simple calculation is fundamental in energy conservation problems.

Pros:

- Clear relationship between work done and energy stored.
- Reinforces concept that work equals change in energy.

Common mistakes:

- Using the wrong height or units.
- Confusing potential energy decrease with increase.

Question 4: Waves and Sound

Question:

A wave travels along a string with a frequency of 20 Hz and a wavelength of 2 meters. What is the speed of the wave?

Answer:

Using the wave speed formula:

$$v = f \lambda$$

where:

- $f = 20 \text{ Hz}$
- $\lambda = 2 \text{ m}$

Calculating:

$$v = 20 \times 2 = 40 \text{ m/s}$$

Explanation:

This straightforward relation shows how frequency and wavelength determine wave speed.

Pros:

- Simple and intuitive.
- Useful for understanding wave behavior in different media.

Common mistakes:

- Confusing frequency and period.
- Forgetting units or miscalculating.

Question 5: Electricity and Circuits

Question:

In a series circuit with a 12 V battery and two resistors of 4 Ω and 6 Ω , what is the current flowing through the circuit?

Answer:

First, find the total resistance:

$$R_{\text{total}} = R_1 + R_2 = 4\, \Omega + 6\, \Omega = 10\, \Omega$$

Using Ohm's Law:

$$I = \frac{V}{R} = \frac{12\, \text{V}}{10\, \Omega} = 1.2\, \text{A}$$

Explanation:

In a series circuit, resistances add directly. The current is the same throughout all components.

Pros:

- Reinforces the principle of series circuits.
- Fundamental for understanding circuit analysis.

Common mistakes:

- Using the wrong resistance value.
- Confusing series with parallel circuit calculations.
