A pulley system has a mechanical advantage of 4. If a force of 50 pounds is used to lift an object, what is the weight of the object?

Solution:

$$\text{Weight} = \text{Force} \times \text{Mechanical Advantage} = 50 \text{ lbs} \times 4 = 200 \text{ lbs}$$

Question 2:

In a gear train, Gear A has 20 teeth, and Gear B has 40 teeth. If Gear A rotates clockwise at 100 RPM, what is the rotation speed and direction of Gear B?

Solution:

Speed ratio = Number of teeth on Gear B / Number of teeth on Gear A = $40 / 20 = 2$

Gear B will rotate at $100 \text{ RPM} / 2 = 50 \text{ RPM}$, and due to gear engagement, the direction will be opposite (counterclockwise).
