## Key Concepts in Chapter 7

### Similar Figures

Similar figures are figures that have the same shape but not necessarily the same size. They have corresponding angles equal and sides in proportion.

- **Definition:** Two figures are similar if their corresponding angles are equal and their corresponding sides are in proportion.

- **Notation:** Usually denoted with the symbol  $\sim$  (e.g.,  $\triangle ABC \sim \triangle DEF$ ).

## Proportions and Ratios

Proportions are equations that state two ratios are equivalent, a fundamental skill for solving similarity problems.

- Setting up ratios:  $\frac{AB}{DE} = \frac{BC}{EF}$
- Cross-multiplication to solve for unknowns
- Understanding scale factors between similar figures

## Theorems Related to Similarity

## Sample Practice Questions and Solutions

Below are some typical questions you might encounter on a Chapter 7 test, along with explanations:

### Question 1: Identifying Similar Triangles

Given two triangles,  $\triangle ABC$  and  $\triangle DEF$ , with  $\angle A = \angle D$ ,  $\angle B = \angle E$ , and side  $AB = 6$  cm, side  $DE = 9$  cm. If the sides are in proportion, find the length of side  $BC$  if side  $EF$  corresponds to side  $AC$ , which is 8 cm.

#### Solution:

Since  $\triangle ABC \sim \triangle DEF$  by AA, the proportions are:

$$\frac{AB}{DE} = \frac{BC}{EF} = \frac{AC}{DF}$$

Given:

$$\frac{6}{9} = \frac{BC}{?} \quad \text{and} \quad \frac{8}{DF}$$

Assuming  $EF$  corresponds to  $AC$ , then:

$$\frac{6}{9} = \frac{BC}{8}$$

$$\frac{AB}{DE} = \frac{AC}{DF} \Rightarrow \frac{6}{9} = \frac{8}{DF} \Rightarrow DF = \frac{8 \times 9}{6} = 12 \text{ cm}$$

]

Now, find BC:

[

$$\frac{6}{9} = \frac{BC}{EF}$$

]

But since EF corresponds to AC (8 cm), then:

[

$$\frac{6}{9} = \frac{BC}{8} \Rightarrow BC = \frac{6}{9} \times 8 = \frac{2}{3} \times 8 = \frac{16}{3} \approx 5.33 \text{ cm}$$

]

Answer: BC = 5.33 cm

## Question 2: Applying the Pythagorean Theorem in Similar Figures

A right triangle has legs measuring 6 cm and 8 cm. It is similar to another right triangle, where the hypotenuse measures 15 cm. Find the lengths of the corresponding legs in the larger triangle.

### Solution:

First, find the scale factor:

[

$$\text{Hypotenuse in small triangle} = \sqrt{6^2 + 8^2} = \sqrt{36 + 64} = \sqrt{100} = 10 \text{ cm}$$

]

Scale factor:

\[

$$k = \frac{\text{Large hypotenuse}}{\text{Small hypotenuse}} = \frac{15}{10} = 1.5$$

\]

Apply scale factor to legs:

\[

$$\text{Legs in large triangle} = 6 \times 1.5 = 9, \text{ cm}$$

\]

and

\[

$$8 \times 1.5 = 12, \text{ cm}$$

\]

Answer: The legs are 9 cm and 12 cm.

## Common Mistakes to Avoid

While practicing, students often make the following errors:

- Confusing congruence with similarity; they are related but not the same.
- Mislabeling angles and sides in diagrams, leading to incorrect setup of proportions.
- Forgetting to check the conditions of theorems; not all triangles are similar unless the criteria are met.
- Incorrectly solving proportions by cross-multiplying or miscalculating.
- Overlooking the importance of drawing accurate and labeled diagrams for visual understanding.

Careful review and practice can help avoid these pitfalls.
